Sprint 4 Goal

Complete all planned must-have features as version 1.0.0.

Key backlog items and teams are specified in the Updated Board section at the end of this document.

Definition of Done

- All must-have features implemented.
- All linting and formatting checks passed.
- All critical unit, integration, E2E tests passed.
- Deployment environment set up and configured.
- Updated all documentations for users and developers.

Release Plan

Version Information

Release Name: Version 1.0
Release Number: 1.0.0
Release Date: 12th November 2025
Responsible Team: Dev A, Dev B, Dev C

Scope

This release focuses on implementing usable Must-Have features:

- Email/password registration and login.
- User profile page.
- Portfolio management: upload, edit, delete, browsing, display.
- User management: admin user management, account status management, role management.

Deployment Method

We will deploy this as a web application the user can access online. The method involves:

- Deploying the frontend (React/Vite) to a hosting service like Vercel, etc.
- Deploying the backend (Elysia.js) to a hosting service like Render, etc.
- Database is hosted by Supabase.

We can then integrate these services as a CD workflow.

Configuration Requirements

1. Environments

We maintain two main environments:

- Development: For local development on team member's machines. Configuration for this environment is managed via `.env` file.
- Production: For live access for users. Configuration is managed through secure environment variable settings in hosting providers' interfaces.

2. Dependencies

The application relies on:

- Node.js
- Bun

All frontend and backend dependencies are listed in the `package.json` file, and automatically installed via bun during the deployment process.

3. Ports

- Frontend: `5173` for local development. `80` for HTTP and `443` for HTTPS inherently handled by hosting provider.
- Backend:
    - `8080` for development.
    - Will be set by the `PORT` environment variable by the hosting provider in production.

4. Credentials

The application requires the following environment variables to function:

- SUPABASE_URL: URL of the Supabase instance.
- SUPABASE_SERVICE_ROLE_KEY: The secret service role key for Supabase.
- JWT_SECRET: A secret string for signing and verifying auth tokens.
- GOOGLE_CLIENT_ID: The client ID for Google OAuth authentication.
- GOOGLE_CLIENT_SECRET: The client secret for Google OAuth authentication.
- FRONTEND_URL: The public URL of the deployed frontend.
- BACKEND_URL: The public URL of the deployed backend.
- VITE_BACKEND_URL: The public URL of the deployed backend.

These will be set in the hosting providers' interfaces.

Rollback/Recovery Plan

Since we use trunk-based development, we will use feature flags to disable the change that cause the bug or issue. We will also utilize roll back features from hosting providers to revert to a stable past deployment in the case of failure. For database recovery, we can utilize reverting schema changes or backups.

Documentation Deliverables

- User Manual: Documentation for users, written as markdown files, potentially hosted as an online website.
- Developer Documentation:
    - `CONTRIBUTING.md` and `README.md` in the project repository.
    - Other markdown files documenting various parts of the project's functionality and relevant details.
    - Auto-generated API guide from source code.

Testing Checklist

- E2E-001: A new user can successfully register for an account and is redirected to the dashboard.
- E2E-002: A registered user can successfully log in and out of the application.
- E2E-003: An unauthenticated user is prevented from accessing protected pages.
- E2E-004: A logged-in user can successfully upload a new portfolio item, and it appears on their profile.
- E2E-005: The main gallery correctly displays newly uploaded portfolio items.
- E2E-006: A user can successfully edit the description of a portfolio item they own.
- E2E-007: A user can successfully delete a portfolio item they own.
- E2E-008: An admin user can deactivate a user's account, preventing them from logging in.

Updated Board

Project Feature/Task	Description	MoSCoW Priority	Story Point	Rationale/Comments	Assigned To	Sprint	Status
Implement gmail authorization	Implement OAuth 2.0 login with G mail API for single sign-on	Must-have	8	งานสำคัญต้นโปรเจกต์ ใช้เวลาเชื่อม API และตั้งค่าใน Google Console	Dev A	Sprint 4	Done
email/password login	Build user authentication system using email/password	Must-have	8	ฟังก์ชันหลักของระบบ ต้องเชื่อม DB, ตรวจสอบ session/token	Dev A	Sprint 4	To Do
email/password registration	Allow new users to register accounts and save data to DB	Must-have	13	ฟังก์ชันสำคัญเชื่อม backend + frontend พร้อม validation	Dev A	Sprint 4	To Do
password reset functionality	Implement "Forgot password" with token-based reset	Must-have	8	ต้องทำระบบส่งอีเมล + token reset + validation	Dev B	Sprint 4	To Do
portfolio browsing and display	Display portfolios on homepage with filtering/search	Must-have	13	หน้าหลักแสดงผลงาน พร้อมระบบค้นหาและแยกตาม role	Dev C	Sprint 4	To Do
portfolio upload	Create upload form (image + description) with validation	Must-have	5	มีการอัปโหลดไฟล์ + ตรวจสอบชนิดข้อมูล เพิ่ม usability	Dev B	Sprint 4	To Do
user profile page	Design and implement personal profile page	Must-have	5	เพิ่มหน้าโปรไฟล์ส่วนตัวและการแจ้งเตือน Nice-to-have	Dev C	Sprint 4	To Do
account linking	Allow user to link Gmail + Email accounts together	Must-have	13	ต้องเชื่อมบัญชี Gmail กับระบบ login เดิม และ feedback test	Dev A	Sprint 4	To Do
admin privilege management	Add admin role management (CRUD for users and content)	Must-have	13	Admin ต้องสามารถกำหนด/ลบสิทธิ์ และตรวจสอบกิจกรรม	Dev C	Sprint 4	To Do
portfolio delete	Enable users/admin to delete uploaded portfolios	Must-have	5	ฟังก์ชันลบข้อมูลพื้นฐาน ใช้ยืนยันก่อนลบ	Dev B	Sprint 4	To Do
editing user profile's information	Add edit profile form (image, name, bio, link)	Must-have	5	ปรับปรุงหน้าโปรไฟล์ให้ผู้ใช้แก้ไขข้อมูลได้	Dev C	Sprint 4	To Do
